

<b>Title</b>	<b><i>Reference Design Report for a 0.48 W Non-Isolated Power Supply With Lossless AC Zero-Crossing Detection Using LinkSwitch™-TNZ LNK3302D</i></b>
<b>Specification</b>	90 VAC – 305 VAC Input, 6 V, 80 mA Output
<b>Application</b>	Home and Building Automation
<b>Author</b>	Applications Engineering Department
<b>Document Number</b>	RDR-874
<b>Date</b>	June 8, 2022
<b>Revision</b>	1.1

### **Summary and Features**

- Highly integrated solution with LNK3302D
- Low-component count with integrated 725 V power MOSFET, current sensing and protection
- Wide-range AC input
- <200 µA standby input current across AC line
- Zero-crossing signal output synchronized to AC line
- Meets EN550022 and CISPR-22 Class B conducted EMI
- Compact solution 1" x 1", 10 mm maximum height
- <20 mW no-load input power
- Load short-circuit protection

### **PATENT INFORMATION**

The products and applications illustrated herein (including transformer construction and circuits external to the products) may be covered by one or more U.S. and foreign patents, or potentially by pending U.S. and foreign patent applications assigned to Power Integrations. A complete list of Power Integrations' patents may be found at [www.power.com](http://www.power.com). Power Integrations grants its customers a license under certain patent rights as set forth at <https://www.power.com/company/intellectual-property-licensing/>.

**Important Note:** Although this board is designed to satisfy safety isolation requirements, the engineering prototype has not been agency approved. Therefore, all testing should be performed using an isolation transformer to provide the AC input to the prototype board.

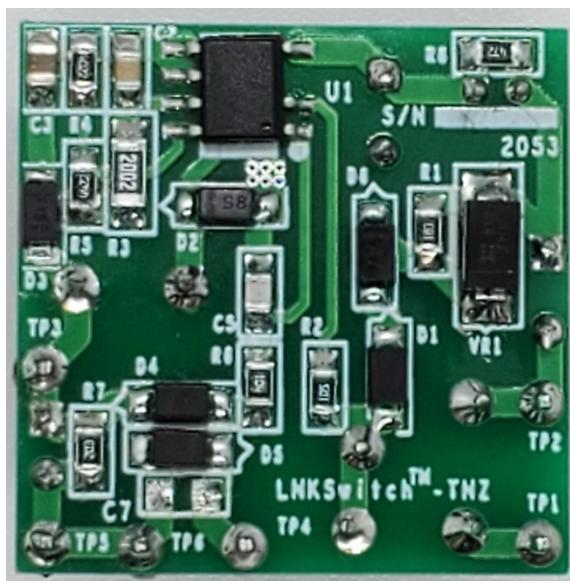

## 1 Introduction

This engineering report describes a high-side buck converter designed to provide a nominal output voltage of 6 V at 80 mA load from a wide input voltage range of 90 VAC to 305 VAC, as well as a zero-crossing detection (ZCD) signal. This power supply utilizes the LNK3302D from the LinkSwitch-TNZ family of ICs.

This document contains the complete power supply specifications, bill of materials, transformer construction, circuit schematic and printed circuit board layout, along with performance data and electrical waveforms.

**Figure 2** – Populated Circuit Board, Bottom View.

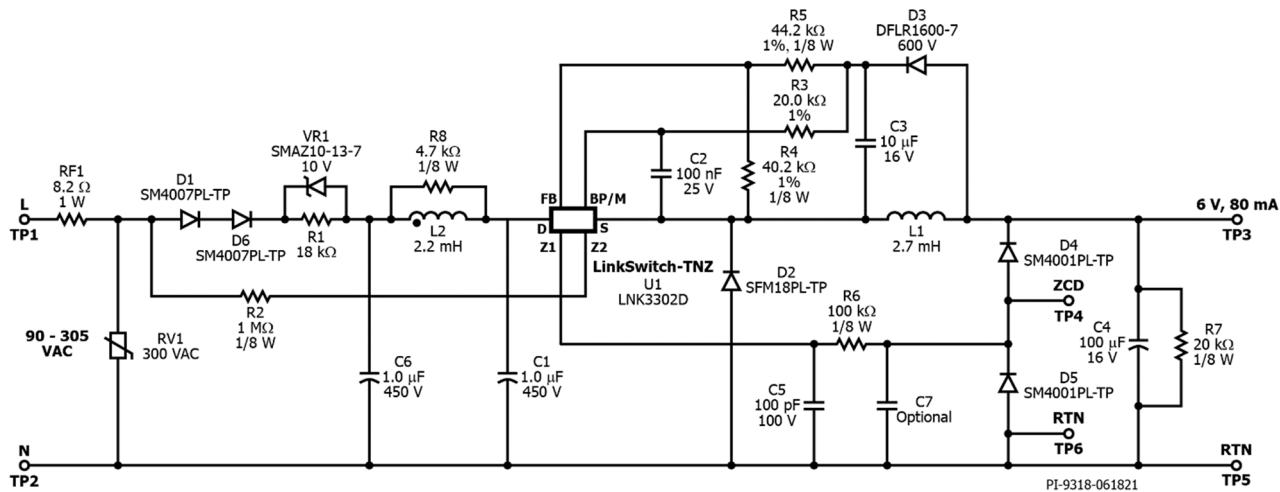

## 2 Power Supply Specification

The table below represents the minimum acceptable performance of the design. Actual performance is listed in the results section.

Description	Symbol	Min	Typ	Max	Units	Comment
<b>Input</b>						
Voltage	<b>V<sub>IN</sub></b>	90		305	VAC	2 Wire – no P.E.
Frequency	<b>f<sub>LINE</sub></b>	47	50/60	64	Hz	
No-load Input Current			150		μA	120 VAC.
			120		μA	230 VAC.
<b>Output</b>						
Output Voltage	<b>V<sub>OUT</sub></b>		6		V	
Output Current	<b>I<sub>OUT</sub></b>		0.08		A	± 5%.
<b>Total Output Power</b>	<b>P<sub>OUT</sub></b>		0.48		W	
Continuous Output Power						
<b>Efficiency</b>	<b>η</b>	60			%	Measured at P <sub>OUT</sub> 25 °C.
<b>Environmental</b>						
Conducted EMI		Meets CISPR22B / EN55022B				
Safety		Designed to meet IEC 60950-1				
Surge		1			kV	1.2/50 μs surge, IEC 1000-4-5, Series Impedance: Surge: 2 Ω
Ring Wave		2.5			kV	Ring Wave: 12 Ω

### 3 Schematic

**Figure 3 – Schematic.**

## 4 Circuit Description

This circuit is configured as a high-side buck topology power supply utilizing the LNK3302D.

### 4.1 Input Rectifier and Filter

The AC input voltage is half-wave rectified by series-connected diodes D1 and D6. The added diode is needed to pass 2.5 kV ring-wave. The series connection is preferred instead of placing the other diode on the Neutral line to measure the zero-crossing signal properly.

The rectified DC is then filtered by the bulk storage capacitors C1 and C6. Inductor L2, C1 and C6 form an input pi filter, which attenuates differential mode conducted EMI. The damping resistor R8 reduces the Q factor of the inductor L2 to allow noise filtering more effective at wider bandwidth.

### 4.2 Input Protection

The fusible resistor RF1 provides safety protection against catastrophic circuit failures. It also reduces inrush current at startup. Varistor RV1 protects against surge events.

### 4.3 Power Factor Circuit

Power Integrations' RZ circuit, that is resistor R1 and Zener diode VR1, minimizes the no-load input current that is important in many 2-wire switch or dimmer applications. VR1 is rated 1W with a 10V clamping voltage. Higher Zener voltage may reduce no-load input current further, but it might cause higher power dissipation during surge. Resistor R1 is tuned either at no-load or at standby, whichever is applicable. The resistance is set such as its peak voltage is just below the Zener voltage. This yields the lowest input current.

### 4.4 LNK3302 Power Supply Operation

LinkSwitch-TNZ combines a high-voltage power MOSFET switch, a power supply controller, and a Zero Crossing Detector in a single device. Unlike conventional PWM (pulse width modulator) controllers, LinkSwitch-TNZ uses a simple ON/OFF control to regulate the output voltage. The LinkSwitch-TNZ controller consists of an oscillator, feedback (sense and logic) circuit, 5 V regulator, BYPASS pin undervoltage circuit, over-temperature protection, line and output overvoltage protection, frequency jittering, current limit circuit, leading edge blanking and a 725 V power MOSFET.

This design is configured as a high-side buck converter using U1 LNK3302. At AC start-up, the device starts switching once the BYPASS (BP/M) pin voltage charges to  $V_{BP}$ . A 100 nF capacitor C2 connected to BP sets the current limit to standard. Resistor R5 provides external bias to the BP/M pin and reduces the no-load input power by setting R5 to provide about 75  $\mu$ A ( $I_{S1}$ ) to the BYPASS pin.

When the MOSFET turns ON, current flows to the load via inductor L1. Energy is stored in the inductor, and the output capacitor C4 gets charged. When the MOSFET turns OFF, the stored energy from L1 is released to the load via free-wheeling diode D2. The charge

stored in C4 supplies the current until the next switching event occurs. Diode D2 must be an ultrafast diode with a reverse recovery time (trr) of 35 ns or less. This is because the converter operates in Continuous Conduction Mode (CCM).

#### 4.5 ***Feedback and Output Voltage Regulation***

In this high-side buck, direct feedback configuration, the rectified voltage across L1 via D3 and C3 tracks the output voltage. Resistors R3 and R4 divides the voltage such that the FB pin is set to 2 V. When the current delivered into this pin exceeds IFB (49  $\mu$ A), a low logic level (disable) is generated at the output of the feedback circuit. This output is sampled at the beginning of each cycle on the rising edge of the clock signal. If high, the power MOSFET is turned on for that cycle (enabled), otherwise the power MOSFET remains off (disabled). The current limit circuit senses the current in the power MOSFET.

When this current exceeds the internal threshold ( $I_{LIMIT}$ ), the power MOSFET is turned off for the remainder of that cycle.

Regulation is maintained by skipping switching cycles. As the output voltage rises, the current into the FEEDBACK pin will rise. If this exceeds  $I_{FB}$ , then subsequent cycles will be skipped until the current reduces below  $I_{FB}$ . Thus, as the output load is reduced, more cycles will be skipped and if the load increases, fewer cycles are skipped.

A small pre-load R7 is required to limit the output voltage to about 110% of the rated voltage during light load or no-load condition.

#### 4.6 ***Zero-Crossing Detection***

Z1 and Z2 pins are configured to provide a loss-less (<5 mW) zero-crossing detection (ZCD) circuit. Z2 is connected to one of the input AC lines through resistor R2 while Z1 forms the ZCD signal output.

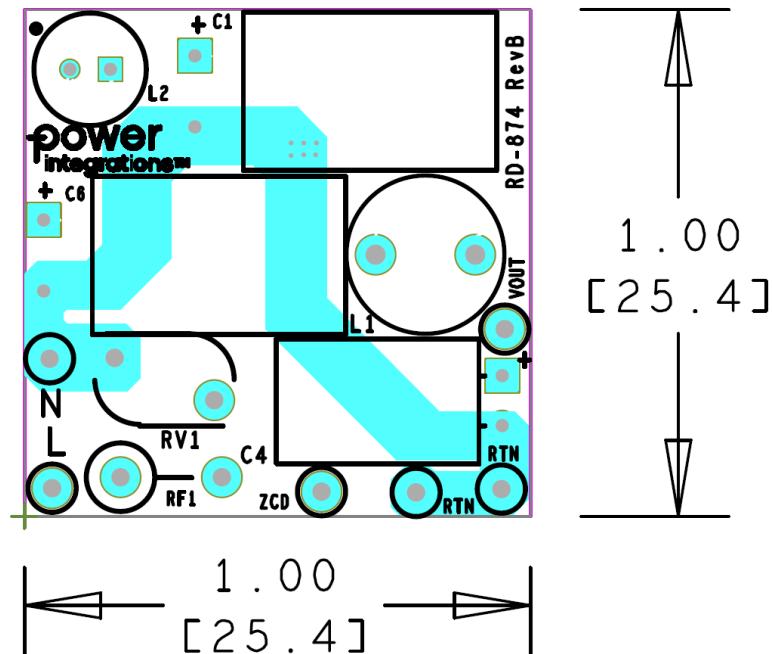

When the AC voltage is more positive with respect to Neutral, D4 is forward-biased and clamps ZCD output to  $V_{OUT} + 0.7$  V. At the negative-going phase of the AC input, D5 is forward-biased and clamps ZCD output to -0.7 V.

The passive components comprised of R2, C5, R6, and optional C7 provide noise filtering to ensure clean ZCD signal. The values are chosen such that the overall ZCD delay is kept below 200  $\mu$ s. C7 is a placeholder for the additional filter if needed. Diode D5 has capacitance that helps avoid adding the extra capacitor. However, too much capacitance will cause more delay.

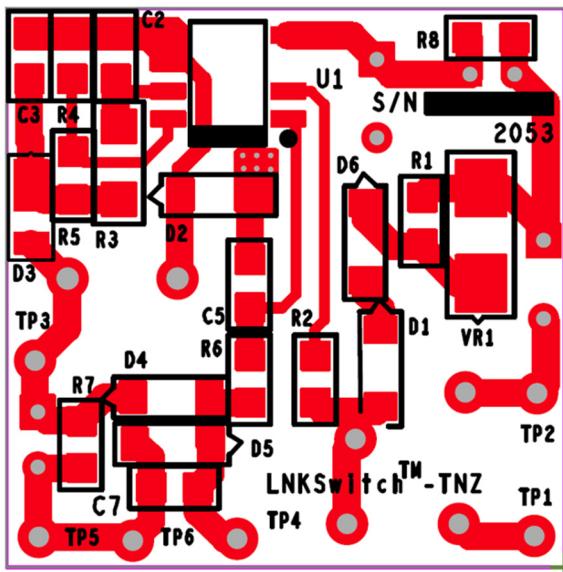

## 5 PCB Layout

Number of layers: 2  
 PCB Board thickness: 1.59 mm / 0.062 inches  
 Material: FR4  
 Copper thickness: 2 oz

 $V_{DS(\text{MAX})} = 397 \text{ V}$ .  
 $I_{DS(\text{MAX})} = 473 \text{ mA}$ .

**Figure 45** – 300 VAC 50 Hz.

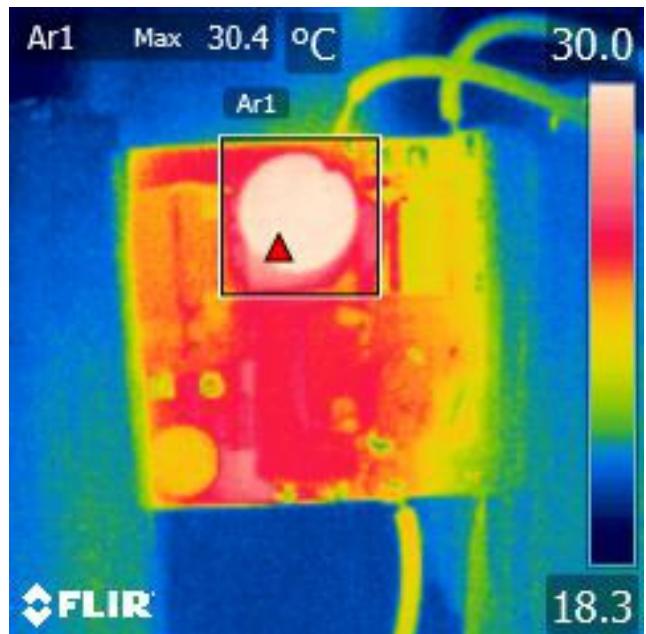

CH2:  $V_{DS}$ , 100 V / div., 5 ms / div.  
 CH3:  $I_{DS}$ , 100 mA / div., 5 ms / div.  
 $V_{DS(\text{MAX})} = 427 \text{ V}$ .  
 $I_{DS(\text{MAX})} = 462 \text{ mA}$ .

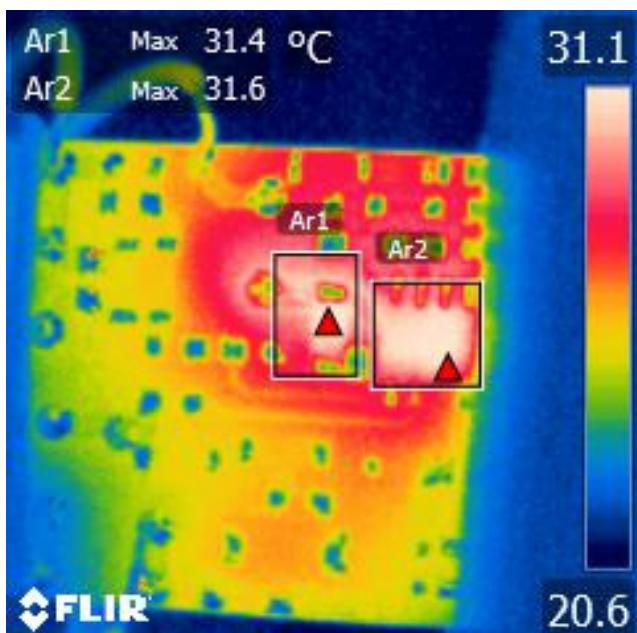

## 10 Thermal Performance

**Figure 46** – 90 VAC 60 Hz, Bottom.

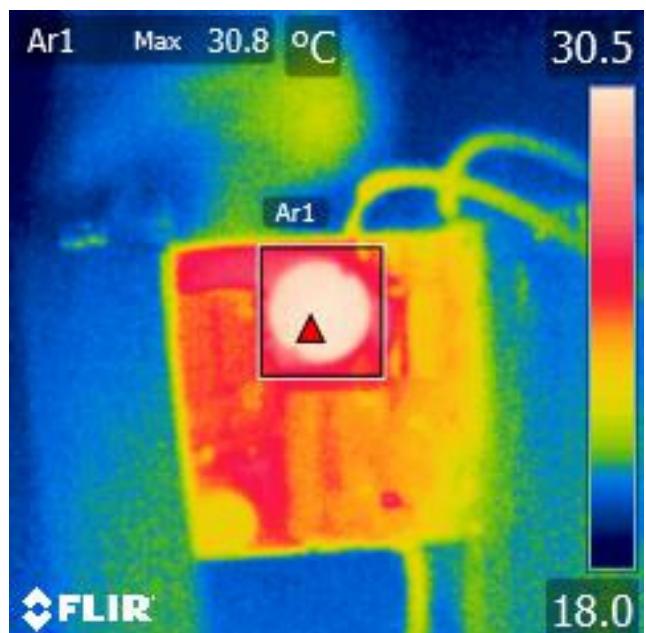

Ar1: VR1, 31.2 °C.  
Ar2: LinkSwitch-TNZ, 29.9 °C.  
Ar3: Freewheeling Diode, 30.9 °C.

**Figure 47** – 90 VAC 60 Hz, Top.

Ar1: Output Inductor, 30.4 °C.

**Figure 48** – 300 VAC 60 Hz, Bottom.

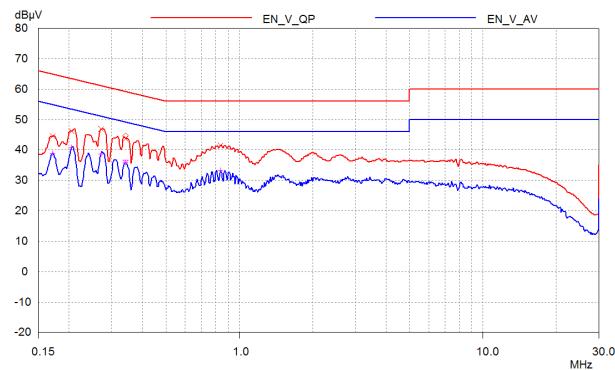

Ar1: Freewheeling Diode, 31.4 °C.  
Ar2: LinkSwitch-TNZ, 31.6 °C.

**Figure 49** – 300 VAC 60 Hz, Top.

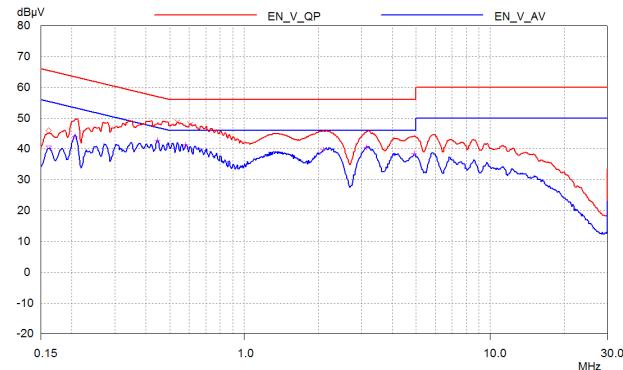

Ar1: Output Inductor, 30.8 °C.

## 11 Conducted EMI

**Figure 50 – 115 VAC 60 Hz.**

**Figure 51 – 230 VAC 60 Hz.**

## 12 Line Surge

Differential and common mode input line surge testing was completed on a single test unit to IEC61000-4-5. Input voltage was set at 230 VAC / 60 Hz. Output was loaded at full load and operation was verified following each surge event.

### 12.1 *Surge*

DM Surge Level (V)	Input Voltage (VAC)	Injection Location	Injection Phase (°)	Test Result (Pass/Fail)
+1000	230	L to N	0	Pass
-1000	230	L to N	0	Pass
+1000	230	L to N	90	Pass
-1000	230	L to N	90	Pass
+1000	230	L to N	180	Pass
-1000	230	L to N	180	Pass
+1000	230	L to N	270	Pass
-1000	230	L to N	270	Pass

**Note:** In all PASS results, no damage and no auto-restart was observed.

### 12.2 *Ring Wave*

Surge Level (V)	Input Voltage (VAC)	Injection Location	Injection Phase (°)	Test Result (Pass/Fail)
+2500	230	L to N	0	Pass
-2500	230	L to N	0	Pass
+2500	230	L to N	90	Pass
-2500	230	L to N	90	Pass
+2500	230	L to N	180	Pass
-2500	230	L to N	180	Pass
+2500	230	L to N	270	Pass
-2500	230	L to N	270	Pass

**Note:** In all PASS results, no damage and no auto-restart was observed.

## 13 Revision History

Date	Author	Revision	Description and Changes	Reviewed
23-Feb-21	DS	1.0	Initial Release.	Apps & Mktg
08-Jun-21	KM	1.1	Updated C2 in Schematic.	Apps & Mktg

Reference Designs are technical proposals concerning how to use Power Integrations' gate drivers in particular applications and/or with certain power modules. These proposals are "as is" and are not subject to any qualification process. The suitability, implementation and qualification are the sole responsibility of the end user. The statements, technical information and recommendations contained herein are believed to be accurate as of the date hereof. All parameters, numbers, values and other technical data included in the technical information were calculated and determined to our best knowledge in accordance with the relevant technical norms (if any). They may base on assumptions or operational conditions that do not necessarily apply in general. We exclude any representation or warranty, express or implied, in relation to the accuracy or completeness of the statements, technical information and recommendations contained herein. No responsibility is accepted for the accuracy or sufficiency of any of the statements, technical information, recommendations or opinions communicated and any liability for any direct, indirect or consequential loss or damage suffered by any person arising therefrom is expressly disclaimed.

Power Integrations reserves the right to make changes to its products at any time to improve reliability or manufacturability. Power Integrations does not assume any liability arising from the use of any device or circuit described herein. POWER INTEGRATIONS MAKES NO WARRANTY HEREIN AND SPECIFICALLY DISCLAIMS ALL WARRANTIES INCLUDING, WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF THIRD PARTY RIGHTS.

**Patent Information**

The products and applications illustrated herein (including transformer construction and circuits' external to the products) may be covered by one or more U.S. and foreign patents, or potentially by pending U.S. and foreign patent applications assigned to Power Integrations. A complete list of Power Integrations' patents may be found at [www.power.com](http://www.power.com). Power Integrations grants its customers a license under certain patent rights as set forth at <http://www.power.com/ip.htm>.
